Project Management and Documentation

Project Management and Documentation Gathering (Gantt Chart and PERT Chart)

Omar Ahmed Soliman Soliman (23011370)

Project management focused on maintaining balanced task distribution and effective time management to ensure that each team member met their assigned deadlines.

The final task involved organizing the project timeline and workflow using project management tools. The Gantt Chart was created to schedule tasks and track progress over time, while the PERT Chart was used to analyze task dependencies and identify the critical path. This ensures that the project is completed within the planned timeframe and resources are efficiently managed.

Additionally, project management ensured proper coordination between tasks and continuous tracking of progress throughout the project lifecycle.

1. Project Selection and Task Distribution

The project team collaboratively selected the Online Food Delivery System after evaluating several potential ideas.

After agreeing on the project, responsibilities were carefully distributed among team members to ensure efficiency, accountability, and balanced workload. Each member was assigned a specific role aligned with their choices.

2. Project Information and Problem Description

Ibrahim Ali Khaled Ibrahim Ibrahim Elwakeel (23010116)

This task involved clearly defining the project concept and explaining the problem the system aims to solve. The responsible member conducted research on food delivery solutions and identified current challenges such as inefficiency, lack of transparency, and poor communication. Based on this analysis, a detailed problem statement and project overview were developed to provide a strong foundation for the rest of the project.

3. System Objectives and Stakeholders

Abdulrahman Hamada Khairi (23011314)

In this step, the system's goals were formally identified, focusing on improving user experience, delivery efficiency, and system reliability. The responsible member also identified all stakeholders interacting with the system, including customers, restaurants, delivery personnel, administrators, and payment providers. Each stakeholder's role and expectations were analyzed to ensure the system meets their needs.

4. Functional and Non-Functional Requirements Gathering

Abdulrahman Mustafa Saeed Mohammed (23012185)

This phase focused on collecting detailed system requirements. Functional requirements describe what the system should do, such as ordering and tracking, while non-functional requirements define how the system should perform, including security, performance, and usability. The member

ensured that requirements were comprehensive, clear, and aligned with the system objectives.

5. Requirements Analysis

Abdalla Mahmoud Saber Elsayed (23011355)

The gathered requirements were analyzed to ensure they are correct, complete, and feasible. This included identifying dependencies between system components, resolving conflicts, and refining ambiguous requirements. The goal was to ensure the system design would be efficient, scalable, and realistic to implement.

6. Use Case Diagram and Context Diagram

Aser Youssef Mohamed Elbadawy (23012042)

The system was visually modeled using diagrams to represent interactions between users and the system. The Use Case Diagram illustrates the different actions users can perform, while the Context Diagram provides a high-level view of the system and its interactions with external entities such as payment gateways and GPS services. These diagrams help in understanding system boundaries and functionalities clearly.

7. Activity Diagram and State Machine Diagram

Omar Mostafa Ali (23011390)

This task focused on modeling the dynamic behavior of the system. The Activity Diagram represents workflows and processes, such as ordering and delivery steps, while the State Machine Diagram illustrates different states an order goes through (e.g., created, preparing, delivered). These diagrams

help in understanding the system logic and transitions between different stages.
